

# DID YOU KNOW...

that the flu shot is mostly toxic chemicals?

The flu shot consists of the following:

- Ethylene glycol – antifreeze
- Phenol (also known as carbolic acid)  
– this is a disinfectant and a dye
- Formaldehyde – a known carcinogen
- Aluminum – this has been associated with Alzheimer's disease and seizures as well as has produced cancer in laboratory mice but it is still being used as an additive to promote antibody response
- Thimerosal – a mercury disinfectant and preservative that can result in brain injury and autoimmune disease
- Neomycin and Streptomycin – these are used as antibiotics and have been known to cause allergic reactions in some people

Dr. Mercola says that many authors have noted a direct correlation between the number of flu shots one has and the incidence of Alzheimer's; and it is attributed to the aluminum and mercury that is put in every flu shot.
